## Strategy rules

Entry: a stock in the top quartile of the S&P 500 u Nasdaq 100 universe by 126-day risk-adjusted momentum, trading above its 200-day average, falls more than 5% over 5 sessions. Slots (max 25) are filled by momentum rank; each position is 4% of portfolio equity at entry, whole shares. Fills at next-day average price (OHLC/4) with 0.2% slippage each way. Exit: momentum rank decays below the 35th percentile — no trailing stop (a 20% trail subtracts ~4pp CAGR on US data; see RESULTS\_US.md). Tax: 25% flat on net realized gains each Dec 31, losses carried forward. No leverage; idle cash earns nothing. Config selected on Indian data, tested here out-of-sample with no parameter retuning.

Returns Detail

Monthly portfolio returns and calendar-year summary

Monthly returns (%) — net equity, after tax outflows

|      | Jan   | Feb   | Mar   | Apr   | May   | Jun   | Jul   | Aug  | Sep  | Oct  | Nov   | Dec   | Year  |

Mom rank = current cross-sectional momentum percentile (exit below 0.35).  
vs peak = distance from peak close since entry (informational — no trailing stop in this configuration).

This is a research backtest, not a live track record.

**Data.** Daily OHLCV for the current S&P 500 and Nasdaq 100 constituents (514 symbols), split/dividend adjusted (EODHD). Because the universe is today's membership, results carry survivorship bias — and it is stronger here than in the India study: constituents of major US indices are by construction the era's winners. Stocks delisted or dropped during the window are absent. A production engine would use effective-dated membership.

**Execution.** Signals are computed at each close; fills occur the next session at the OHLC/4 average price with 0.2% slippage each way. Position size is 4% of portfolio equity at entry, whole shares only, max 25 positions, no leverage. Idle cash earns nothing. Commissions are not modeled (near zero at US retail brokers); SEC/TAF fees and borrow costs are immaterial for a long-only book at this turnover.

**Taxes.** 25% flat on net realized gains each December 31 with loss carry-forward — a deliberate simplification mirroring the India report, not US tax advice. Actual short/long-term capital-gains treatment depends on holding period and bracket. \$41.9k of gains realized in 2026 remain untaxed in the final figure.

**Validity.** The dip-entry cohort passed the house 6-check validity protocol on Indian data (NSE 500, 2012-2026). The protocol has NOT been run on the US panel; what is shown here is an out-of-sample portfolio-level test of the India-selected rules with one deviation — the trailing stop is dropped, per the US grid in RESULTS\_US.md, which is itself a selection made on this same data (treat with corresponding caution).

**Interpretation.** The 2025-26 semiconductor/memory rally dominates the result: the top 5 open positions (SNDK, WDC, LITE, MU, INTC) are 47% of final equity, and 2026 YTD accounts for much of the total return.

The strategy's concentration in whatever leads the tape is by design — momentum-rank slot priority — but a different regime would produce materially different results. Past performance, simulated or otherwise, does not guarantee future results.
