Strategy rules

Entry: a stock in the top quartile of the NSE 500 by 126-day risk-adjusted momentum falls more than 5% over 5 sessions. Slots (max 25) are filled by momentum rank; each position is 4% of portfolio equity at entry, integer shares. Fills at next-day average price (OHLC/4) with 0.2% slippage each way. Exit: momentum rank decays below the 35th percentile, or a 20% trailing stop from the peak close. No leverage; idle cash earns nothing. Tax: 25% flat on net realized gains at each March 31, losses carried forward. Validity: entry cohort passed the house 6-check protocol (+1.0pp excess at 20d, +3.5pp at 60d vs same-date universe baseline). See tasks/dip_vs_breakout_calls/.

This is a research backtest, not a live track record.

Data. Daily OHLCV for the current NSE 500 constituents, corporate-action adjusted; 33 symbols with unadjusted corporate-action gaps were excluded (list in `tasks/dip_vs_breakout_calls/PLAN.md`). Because the universe is today's membership, results carry survivorship bias — stocks delisted or relegated during the window are absent. A production engine would use effective-dated membership.

Execution. Signals are computed at each close; fills occur the next session at the OHLC/4 average price with 0.2% slippage each way. Position size is 4% of portfolio equity at entry, whole shares only, max 25 positions, no leverage. Idle cash earns nothing (a liquid fund would add $\approx 0.3\text{--}0.6\text{pp/yr}$ on observed cash balances).

Costs & taxes. Slippage only; brokerage, STT, stamp duty and other charges are not modeled and would reduce returns by roughly 0.3-0.5pp per round trip at discount-broker rates. Tax is applied as specified: 25% flat on net realized gains at each March 31 with loss carry-forward; ₹1,54,096 of gains realized after March 2026 remain untaxed in the final figure. Actual STCG/LTCG treatment differs from this flat assumption.

Validity. The entry cohort passed the house validity protocol (all six checks): +1.02pp excess vs the same-date universe baseline at 20 days, +3.45pp at 60 days, direction lift positive at every horizon, persistent across sample halves (2012-2026, $n=978$). The exit rules shape realized P&L on top of that entry edge.

Interpretation. 2023's H2 rally and 2024's dip-rich tape were favourable regimes for this strategy; the flat stretch in FY2026 (realized +₹2.2L on a ₹40L book) is representative of quieter tapes. Past performance, simulated or otherwise, does not guarantee future results.
